

NH Public Water Systems PFAS Results Summary

Certain public water systems are required to test for PFAS in drinking water obtained from approved sources associated with the water system. The water is tested where it enters the distribution system. This table provides the most recent PFAS testing results available for water systems that have sampled for these contaminants, in order by Town name. Please note the following: 1) Many water systems utilize multiple sources of water for water supply. This table provides the results for all of the sources that are listed as “active” and require testing. Those water systems with multiple water sources may have active sources of water that they maintain, but in practice, utilize some of the “active” water sources only to a limited extent; 2) Some water systems may elect to prioritize the use of water sources that produce water with PFAS levels below the new PFAS standards established by USEPA even though the new standards will not take effect for several years; 3) Once in the distribution system, water from different sources may mix in the pipes and water tanks with other approved sources of water hence the actual concentration of PFAS coming out of the taps may be different than each individual source; and 4) The table provides a summary of the most recent PFAS testing result. Compliance with state standards, however, is based on the average of four quarterly samples over a year. 5) The data provided in this table is current as of April 10, 2024.

PWS	SYSTEM TYPE	PWS Name	Town	Site #	Site Description	Date Sampled	Contaminant	CAS Num	Result	Units
